\* The data presented here was collected by the California Native Plant Society (CNPS) – Calscape and the California Invasive Plant Council (Cal-IPC). "Potentially Invasive" species are on Cal-IPC's Watch list—not currently invasive in California but may pose a risk or have invasive varieties. "Limited Invasiveness" species spread slowly and have minor or uncertain ecological impacts, often being locally problematic. "Invasive" species have noticeable effects on ecosystems and spread more easily, especially in disturbed areas. This information is intended to support responsible planting decisions.
